Title: A Synthetic Mattress for Growing Grass

Abstract

This utility model disclosed a synthetic mattress for growing grass which could be used in parks and banks to overcome the shortcomings of current lawn rolls such as small surface area, large unit weight, easy lapsing of soil, etc. The present synthetic mattress with soil for growing grass comprises two layers of synthetic material with seeds and nutrients being sandwiched between them. The synthetic mattress could further comprise soil promoters, which is dependent on the nature of the soil on which it is laid. The present synthetic mattress is light and easy to be transported. The seeds within this synthetic mattress could germinate and grow quickly after being laid and watered.
